SUMMARY

Full Stack Java Developer with hands-on experience building end-to-end web applications using Spring Boot, React, and PostgreSQL. Strong backend foundation in REST API development, microservices architecture, and event-driven systems using Kafka. Experienced in implementing secure JSON Web Token (JWT)-based authentication, integrating third-party APIs, and deploying containerised applications using Docker.

TECHNICAL SKILLS

- **Languages:** Java (Object Oriented Programming), SQL, JavaScript
- **Backend:** Spring Framework, Spring Boot, Spring MVC, Spring Data JPA, Hibernate ORM, Spring Security
- **Frontend:** React (Vite), HTML, CSS
- **Architecture:** Microservices, RESTful Web Services, Event-Driven Systems
- **Databases:** PostgreSQL, MySQL, MongoDB
- **DevOps & Tools:** Docker, Maven, Git, Postman, Swagger/OpenAPI

EDUCATION

Gujarat Technological University (GTU)

Bachelor of Engineering in Information Technology

Mar 2025

Gujarat, India

Jspiders - Java Development Training Institute

Full Stack Java Development

Jan 2026

Bengaluru, India

CERTIFICATIONS AND ACHIEVEMENTS

- Solved 120+ Data Structure and Algorithm (DSA) Problems on LeetCode (50 Days Badge)
- HackerRank – Problem Solving (Intermediate) Certification
- HackerRank – Java (Intermediate) Certification

PROJECTS

Banking Microservices Platform – Java 21, Spring Boot, PostgreSQL, Apache Kafka, Docker, REST API, Swagger

An event-driven banking system built around independent Payment and Ledger services to simulate real-world fund transfers. Reliable transaction processing is achieved through the transactional outbox pattern and idempotent event consumers, preventing duplicate or lost transfers. Kafka handles asynchronous communication while maintaining service isolation and consistency.

Movie Review Platform – Spring Boot, React (Vite), PostgreSQL, Maven, JWT, Docker, Render

A full-stack platform where users can securely review and rate movies with role-based access control. The backend enforces JWT authentication and isolates user permissions at the API level to prevent unauthorised edits. Reviews and ratings are stored relationally with efficient query handling in PostgreSQL. The system is containerised and deployed with environment-specific configuration.

AI-Powered Intelligent Log Monitoring System – Java, Spring Boot, PostgreSQL, Open-AI API, Docker, Web-client

A backend system that converts raw application logs into structured incidents by grouping repeated stack traces and tracking severity. Instead of just storing logs, it generates AI-powered summaries and probable root causes using the OpenAI API. Designed to reduce noise and speed up debugging in production environments.
